

## ABSTRACT

A portable shoehorn can be easily and quickly used when a user puts on his/her shoes, his/her backs are itchy, and a part of his/her body are required to be relieved. In a portable shoehorn 1, a plate member, which is bent in the breadth direction, is also bent in the longitudinal direction approximately like a bow into a slender plate to form a shoehorn and a grip section 1a is fold into two at the central portion to reduce the total length approximately by half. A backscratcher 2 is formed at the tip of the grip section 1a and elastic body 3 for patting the body is mounted attachably/detachably to the backscratcher 2 and to the shoehorn portion 1b of the shoehorn section. The portable shoehorn can be easily and quickly used, while being carried during travelling, such that the shoehorn portion of the shoehorn is used when a user puts on his/her shoes, the backscratcher is utilized when his/her back is itchy, and the elastic body for patting a human body is used like a shoulder tapper when a part of his/her body is required to be relieved, because the portable shoehorn can be folded and also used as a backscratcher and a tool with a function for patting a human body.
